CROSS-REFERENCE TO RELATED APPLICATIONS

The present application is a U.S. National Stage of International Application No. PCT/EP2005/051894, filed April 27, 2005, which claims priority of German Patent Application No. 10 2004 020 711.9, filed April 27, 2004, and German Patent Application No. 10 2005 017 032.3, filed April 13, 2005.

BACKGROUND OF THE INVENTION

SUMMARY OF THE INVENTION

The present invention provides a cosmetic formulation comprising (a) at least one activated aluminum compound which is effective as antiperspirant, (b) at least one α -hydroxycarboxylic acid and (c) water.

In one aspect of the formulation, component (b) may comprise mandelic acid.

In another aspect, component (a) may comprise one or more activated aluminum salts. For example, component (a) may comprise activated aluminum chlorohydrate.

In still another aspect, the ratio of component (a) to component (b) may be from 15 : 1 to 1 : 1, e.g., from 12 : 1 to 2 : 1, or from 10 : 1 to 2.5 : 1.

In yet another aspect, the formulation of the present invention may comprise from 1% to 35% by weight, e.g., from 1% to 25% by weight, or from 1% to 20% by weight, of component (a), based on the total weight of the formulation.

In another aspect of the cosmetic formulation of the present invention, the formulation may comprise from 0.1% to 10% by weight, e.g., from 0.1% to 8% by weight, of component (b), based on the total weight of the formulation.

In another aspect, the cosmetic formulation of the present invention may comprise an O/W microemulsion such as, e.g., a microemulsion gel. For example, the formulation may comprise an oil-in-water microemulsion which comprises an oil phase, a water phase and less than 20% by weight of one or more emulsifiers, based on the total weight of the microemulsion. The oil phase may be essentially composed of constituents of low volatility.

The one more emulsifiers may comprise one or more O/W emulsifiers selected from polyethoxylated, polypropoxylated and polyethoxylated and polypropoxylated O/W emulsifiers and may further comprise one or more optional W/O emulsifiers.

The microemulsion may be obtainable by bringing a mixture comprising the water phase, the oil phase, the one or more O/W emulsifiers, the one or more optional W/O emulsifiers and one or more other optional components selected from auxiliaries, additives and active ingredients to a temperature within or above the phase inversion temperature range and subsequently cooling the mixture to room temperature.

The droplets of the discontinuous oil phase of the microemulsion may be joined together by one or more crosslinker substances whose molecules comprise at least one hydrophilic region which has a size suitable for bridging the distance

between the droplets and at least one hydrophobic region which is able to enter into hydrophobic interaction with the droplets.

In yet another aspect, the cosmetic formulation of the present invention may have a defined yield point, for example, a yield point of from 40 to 120 Pa, determined at 25°C by means of a shear stress time ramp of 40 Pa/min.

In a still further aspect, the formulation may be suitable for application to the human skin.

The present invention also provides a cosmetic formulation which comprises (a) activated aluminium chlorohydrate, (b) mandelic acid and (c) water.

In one aspect of the formulation, the ratio of component (a) to component (b) may be from 10 : 1 to 2.5 : 1.

In another aspect, the formulation may comprise from 1% to 20% by weight of component (a) and from 0.1% to 8% by weight of component (b), each based on the total weight of the formulation.

In yet another aspect, the formulation may comprise an O/W microemulsion.

The present invention also provides an antiperspirant product which comprises the cosmetic formulation of the present invention, including the various aspects thereof set forth above.

In one aspect, the antiperspirant product may comprise a transparent antiperspirant hydrogel.

The present invention also provides an aqueous antiperspirant preparation which comprises at least one antiperspirant activated aluminum compound and at least one α -hydroxycarboxylic acid.

In one aspect of the preparation, the at least one α -hydroxycarboxylic acid may comprise mandelic acid.

DETAILED DESCRIPTION OF THE INVENTION
